

Washington, D. C.

April 13, 1945

FARM WAGE RATES CONTINUE TO RISE
EMPLOYMENT DOWN FROM YEAR AGO

Exerting every effort to secure the help needed to plant 1945 war crops, farmers again raised wage rates paid hired labor to new record highs on the first of this month, the Department of Agriculture reported today. At 335 percent of the 1910-14 average, April 1 farm wage rates average 10 points above the 1944 October peak; and 33 points, or more than 10 percent, higher than a year ago. This is the highest point the wage rate index has reached in 78 years of record.

Although rates were higher than ever before and giving indications of rising even higher, the April 1 farm wage structure was still characterized by extreme geographic variation. Day rates without board ranged from a low of \$2.10 in South Carolina to a high of \$7.70 in Washington State. Recent special surveys of piece-work rates paid harvest workers in two areas of commercial vegetable production reveal that, in many cases, their daily earnings do not average substantially above day wage rates in the southeast. New piece-rate data are available this month covering citrus and vegetable harvest operations in selected areas in Texas. These appear on pages 4 to 7 of this report.

Nearly 9 million persons, out of the supply remaining available for farm work were working on April 1, as compared with 8,400,000 on January 1. The increase since January 1 has been somewhat short of the usual seasonal upturn. Total farm employment on April 1 was a little more than 1 percent smaller than at the same time last year. After adjustment for usual seasonal variation, the index of employment was 81 compared with 83 on March 1, and 82 on April 1, 1944.

April 1 employment of family labor at 7,322,000 persons, was approximately 428,000 persons, or about 6 percent more than on March 1, and 1 percent less than on April 1, 1944. The number of hired farm workers increased more than 9 percent during March, and was about 1 percent less than the number of hired workers employed on April 1, 1944. Generally favorable weather in many parts of the country, however, enabled farmers to utilize available help rather fully during the latter part of March.

Total employment increased over last year in Middle Atlantic, East North Central and West South Central regions. The number of unpaid family workers employed in agriculture increased in all regions during March, but dropped below April 1, 1944 levels in all parts of the country except Middle Atlantic and East North Central States.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

Reflecting the present scarcity of farm help, crop correspondents reported a supply of labor available for farm work only 52 percent of the pre-war 1935-39 average. This was a decline of 4 points since January 1 and a downturn of 2 points below a year ago to the smallest April appraisal of the supply situation that farmers have reported during the twenty seven years such questions have been carried on the general crop schedule. The demand for farm help was reported to be 27 percent higher than during the 1935-39 base period. This was seasonally higher than on January 1 and the same as a year ago.

Index numbers of supply of and demand for farm labor appear for the last time in this month's Farm Labor Report.

Field Work Gets Fast Start in Northeast

In New England, the snow cover has disappeared from all except the most northern locations and with warm weather in late March vegetation has made much more than normal growth. Maple sugar bush operations were largely terminated before April by unseasonably warm weather. Planting of early vegetables and potatoes in southern New England had started by the first of this month.

New England farmers increased the number of workers hired by 3,000 persons during March to 216,000 or the same number reported a year earlier. The index of the available supply of farm labor is 2 percent higher than in April 1944 and 1 percent lower than in January of this year. The index of demand, however, is 4 percent less than was estimated for last year and 1 percent above the January index. New England wage rates increased from 314 percent of their 1910-14 average in April 1944 and 323 in March 1945 to 341 as of April 1, 1945. Monthly wage rates were 6 percent higher on April 1 than on January 1 and 9 percent higher than on April 1, 1944.

The index of farm labor supply declined more than 9 percent in Middle Atlantic States from April 1944 to April 1945, the index of demand declined only 2 percent, while the index of farm wage rates rose nearly 12 percent. Because of the mild weather throughout most of this area, spring planting operations were going "full blast" on the first of this month. This has made it possible for farmers to use both workers and machinery more efficiently than in 1944.

In the East North Central States, a scarcity of able-bodied hired labor and wet fields have hindered spring soil preparation in many areas despite one of the most advanced seasons of record. The number of hired workers on farms was about 6 percent smaller than a year ago. The index of wage rates for this region increased from 272 in April 1944 to 307 in April this year. Around April 1, farmers were going ahead as fast as possible with their spring plowing. Seeding oats was fairly well advanced in some areas; planting in Wisconsin was the earliest in 25 years.

Reports from the West North Central region indicate a similar scarcity of hired workers, and even fewer family workers this year than last. However, spring planting made good progress in most parts of the region; the last week of March was sunny and fine for farm work. Oat seeding was completed by April 1 in some

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

parts of Iowa; corn planting had begun in extreme south-central Kansas; and considerable progress was made in planting potatoes and truck crops. The index of farm wage rates advanced from 265 in April 1944 to 312 in April 1945, an increase of nearly 18 percent.

A warm, dry week found farmers in the South Atlantic region busily engaged in a variety of spring planting operations around April 1. This early start enabled farmers to get along with a little less help than a year ago. Seasonal work progressed rapidly. Among other things oats were being seeded in Maryland; tobacco was being transplanted in the Carolinas and Georgia; and beans, eggplant, peppers, tomatoes, and cucumbers were being shipped from Florida. All this activity was accompanied by a continued decrease in the supply of labor and a sharp increase in farm wage rates. The April 1 wage rate index, at 292 percent of the 1910-14 average was 16 percent higher than a year ago.

In the East South Central region farmers also continued to raise wage rates, in an effort to compete with the even higher rates paid in industry, as cotton planting began in the southern part of the Belt and corn planting became general. The number of farm workers employed on the first of April was about 5 percent smaller than a year ago, and wage rates averaged about 17 percent higher.

The West South Central region reports 1 percent fewer family workers, but 10 percent more hired workers employed as of April 1 this year than last. Wet grounds hindered field work in many parts of the region, but corn and rice planting made considerable progress in Louisiana. Cotton planting was delayed by rain in many parts of Texas and Oklahoma, and some Arkansas farmers reported spring planting operations as much as a month behind schedule. April 1 farm wage rates in the West South Central States were about 20 percent higher than a year ago.

The number of farm laborers employed in the Mountain region was 4 percent less than on last April 1, and wage rates continued to rise. At 305 percent of the 1910-14 average, wage rates were 16 percent higher than a year ago. Farmers reported that the supply of workers was only half as large as in the late thirties.

In the Pacific region reports indicated that the number of persons working on farms was about the same as a year ago. With farm wage rates higher than anywhere else in the country, the increase since April 1 last year amounts to only about 7.5 percent. Farm work was making rather good progress by April 1. Sugar-beet planting was well along in Washington State, considerable plowing and seeding of spring grains was being done in Oregon, while California growers were thinning beets, planting cotton, picking citrus and harvesting carrots.

WAGE RATES AND EARNINGS OF CITRUS FRUIT PICKERS AND VEGETABLE
HARVESTERS IN SELECTED AREAS OF TEXAS, FEBRUARY AND MARCH, 1945

Piece rates for picking citrus fruit and harvesting vegetables in parts of South Texas during selected weeks of February and March resulted in average daily cash wages between \$2 and \$4 for most of the operations. Citrus pickers averaged \$3.20 per day with only 4 percent making \$5 or more. Special surveys to obtain wage information were made of citrus pickers employed by packing houses and of agricultural workers housed in WFA Labor Supply Centers during the week February 18-24, 1945, in the Lower Rio Grande Valley. Another survey was made of wages paid laborers in the Winter Garden area on farms which were harvesting spinach, carrots, or both, during the week of March 11-17, 1945. These surveys were made as part of the expanded work of the Bureau of Agricultural Economics in the collection of information on farm wage rates.

The Lower Valley survey covered Cameron, Hidalgo, and Willacy Counties, which produce practically all of the Texas grapefruit and oranges and are important in the production of winter vegetables. The survey was timed to cover a peak week in the harvest of both citrus and vegetables.

In the Winter Garden area, the survey covered Dimmit and Zavala Counties, the principal spinach producing area of the State and also important in the production of other vegetables. The survey week was after the peak of the harvest, but in a still active season, as 93 percent of all hired farm workers in the survey were cutting spinach, pulling carrots, pulling onion plants, or doing some combination of these operations.

Wage rates paid - Piece rates paid in the Winter Garden area for harvesting vegetables were more uniform than the rates paid for picking citrus by packing houses in the Lower Valley. Although in Texas there are no wage-ceiling regulations for specific agricultural operations, the rates for vegetable harvesting were very uniform. Every laborer surveyed in the Winter Garden area who harvested carrots in bulk during the week was paid at a rate of 10 cents per 50-pound sack, every spinach cutter was paid 15 cents per bushel, and every worker pulling onion plants was paid 30 cents per crate. Only for pulling carrots for bunching was there any variations in the piece rates paid for the harvest operations surveyed in the Winter Garden area, with the rates ranging from 5 to 6.5 cents per dozen bunches. In the Lower Valley, however, the rates for picking grapefruit ranged from 3.5 cents to 7 cents per box, averaging 4.8 cents. Rates for picking budded oranges ranged from 3.5 to 10 cents, and averaged 7.2 cents.

Daily earnings of piece workers - The average cash wage earned by citrus pickers in the Lower Valley was \$3.20 a day as compared with the average of \$2.60 earned by vegetable harvesters housed in WFA Labor Supply Centers in the same area, and \$2.90 a day earned by workers harvesting carrots, spinach, and onions (plant pulling) in the Winter Garden area. Spinach cutters made the highest average daily wage in the Winter Garden area, \$4.30 per day, while workers harvesting carrots in bulk made the lowest, \$1.90 per day. Male vegetable harvesters made higher daily wages than female harvesters in all the operations surveyed in the Winter Garden area except in pulling carrots in bulk, for which daily earnings of females averaged higher than those of males. However, the average daily wage of all male harvest workers was practically the same as that for female harvest workers.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

Daily earnings of individual workers picking citrus showed considerable variation from the average of \$3.20. Forty percent of the citrus pickers averaged between \$3 and \$4 for each day actually worked during the week; only 18 percent exceeded \$4 per day, and only 1 percent exceeded \$6 per day. Ten percent of all the citrus pickers averaged less than \$2 per day, and 32 percent had average daily wages between \$2 and \$3.

Average length of work-day - The higher average daily wage for citrus fruit pickers than for workers performing most of the other farm operations surveyed was not due to a longer work-day, as the citrus pickers averaged 6.8 hours, the smallest number of hours worked per day of all groups surveyed. Agricultural workers housed in WFA centers in the same area averaged 8.1 hours per day, while the carrot and onion plant pullers and the spinach cutters in the Winter Garden area averaged 8.5 hours per day, and all other workers on the same farms averaged 9.2 hours per day. There was no difference in the average number of hours worked per day on harvest operations by males and females in the Winter Garden area. In this area, 19 percent of all the vegetable harvesters were female.

Average length of work-week - Citrus pickers worked an average of 4.7 days per week on the crew from which the report was obtained. Because some workers may have put in additional time on other crews, this average may slightly understate their total time spent in picking citrus during the week. However, the average for citrus pickers is 1 day longer than the average of 3.7 days per week reported by the agricultural workers housed in WFA Labor Supply Centers, where the information on all time spent in agricultural work during the week was obtained from each individual worker. About half of the workers in the Labor Supply Centers surveyed reported that they worked on two or more farms during the week, and 11 percent reported that they worked on four or more different farms. The crews of workers harvesting vegetables in the Winter Garden area averaged 4.5 days per week, but not all individuals in the crew worked every day the crew did.

Weekly wages earned by the laborers surveyed - Citrus pickers averaged \$15.10 weekly wages for picking done on the crew from which reports were obtained. Forty-six percent of the citrus pickers made between \$10 and \$20 during the week, with 28 percent earning less than \$10 and 26 percent making more than \$20. Only 1.5 percent of the workers made as much as \$30 on the reporting crew. Agricultural workers housed in WFA Labor Supply Centers in the Lower Valley had average weekly earnings of \$15.00, almost identical to those of the citrus pickers of the area. The workers in WFA Centers had higher daily earnings than the citrus pickers, but this was offset in total weekly earnings since they averaged one day less per week than the citrus pickers. For male workers aged 18-44 in WFA Centers, higher hourly earnings and slightly longer hours per week brought their average weekly wages to \$18.90, as compared with \$11.50 for other male workers in the Centers and \$9.50 for female workers. The average weekly wage of \$13.30 for vegetable harvesters in the Winter Garden area represents the average amount earned by a worker who worked each day the crew did. This average for vegetable harvesters is somewhat lower than the average weekly wage of \$16.80, earned by all other hired workers on the same farms.

1/ Estimates for citrus picking are based on records for the week of February 18-24 for a sample of crews employed by packing houses in Cameron, Hidalgo, and Willacy Counties. Estimates for workers housed in WFA Labor Supply Centers are based on a survey of a sample of 10 percent of all workers (domestic whites) in the 4 Labor Supply Centers in Cameron, Hidalgo and Willacy Counties. The wage information relates to the week of February 18-24.

2/ Estimates are based on records for a sample of one or more crews of workers from every packing house and grower harvesting spinach and/or carrots in Dimmit and Zavala Counties, Texas, during the week of March 11-17.
